

# Semantic Search

## A Guide to Web Research: Lecture 4

Yury Lifshits

Steklov Institute of Mathematics at St.Petersburg

Stuttgart, Spring 2007

1 / 32

## Outline

- 1 Introduction to Semantic Web
  - Concept and History of Development
  - Architecture of Semantic Web
  - Concept of Semantic Search
- 2 Three Algorithms for Semantic Search
  - Minimal Answers
  - Concept Matching
  - Computing Interconnections
- 3 Directions for Further Research

3 / 32

The challenge of the Semantic Web, therefore, is to provide a language that expresses both data and rules for reasoning about the data and that allows rules from any existing knowledge representation system to be exported onto the Web.

*T. Berners-Lee, J. Hendler, O. Lassila  
Semantic Web, 2001*

2 / 32

## Part I Semantic Web

What is it?

What is already done?

What remains to be done?

4 / 32

## Motivating Scenarios

### A person asking his web-agent:

- Book the ticket for the movie “The Lives of Others” in the nearest cinema that shows it today evening
- Find a suitable wine for every item in this menu. If possible, choose French
- Microwave, please, go to the website of the dish manufacturer and download the optimal parameters for cooking

5 / 32

## Timeline

- **1994:** Foundation of W3C. They develop standards such as: HTML, URL, XML, HTTP, PNG, SVG, CSS
- **1998:** Tim Berners-Lee published “Semantic Web Road Map”
- **1999:** W3C launched groups for designing Semantic Web foundations, the first version of RDF is published
- **2000:** American defence research institution started investigations for ontology descriptions (DAML+OIL project)
- **2001:** “The Semantic Web” paper in Scientific American
- **2004:** New version of RDF, ontology description language OWL
- **2006:** Candidate recommendation of SPARQL, a query language for Semantic Web

6 / 32

## Naïve Plan

- 1 Develop a MEGA-language that is powerful enough to describe all human knowledge and is machine understandable at the same time.
- 2 Force all web publishers translate their websites to this language
- 3 Write programs that can search in and reason about all the information in the web

There is a more practical solution for the first step

7 / 32

## RDF and OWL

Tim Berners-Lee suggested to **separate** development of syntax and semantic of this MEGA-language:

Resource Description Framework (**RDF**) is a syntax for documents of Semantic Web. It uses links to **ontologies**

Ontology Web Language (**OWL**) is a language for ontology description

**Ontology** describes classes of objects, their properties and relationships in some domain, e.g. toy shops

8 / 32

## Semantic Web Step-by-Step

- 1 Syntax for knowledge representation (done: RDF)
- 2 Ontology description language (done: OWL)
- 3 Web-services description language (started: OWL-S)
- 4 Tools for reading/publishing Semantic Web documents (started: Jena, Haystack, Protege)
- 5 Query language for data represented by RDF (started: SPARQL)
- 6 Logic reasoning about RDF statements (to be done)
- 7 Semantic search and semantic agents (to be done)

9 / 32

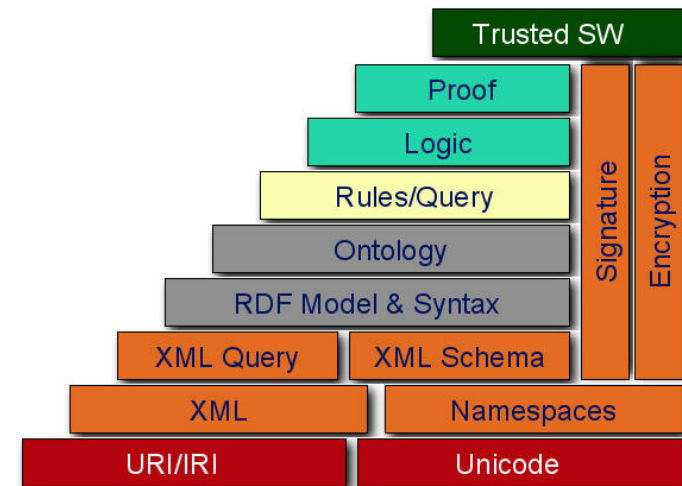

## Concept of Semantic Search

What is **semantic search**?

- Assistance to classical web search
- Question answering systems
- Queries that returns concepts (nodes in XML documents), not documents themselves
- Query is a complex concept (small XML tree), semantic search returns the most similar object
- SQL-like queries to database of RDF statements
- Automated logical inference for RDF statements

11 / 32

## Cake of Tim Berners-Lee

10 / 32

## Part III Three Algorithms for Semantic Search

Finding the most specific answer

Concept matching

Identifying related nodes in XML documents

12 / 32

## XRANK: Model

Database is a set of **XML documents**

There are **hyperlinks** between nodes

Every node contain some **text**

Query is a short list of keywords

A **complete** answer is a node that together with its descendants contain all query terms

13 / 32

## Minimal Answers

A node  $v$  is called to be a **minimal answer** if

$$\forall k \in Q : \\ [v \text{ contains } k] \\ \text{OR} \\ [\exists u \text{ son of } v \text{ s.t. } u \text{ contains}^* k \\ \text{AND } u \text{ is not complete answer}]$$

**Search task:** find all minimal answers and rank them accordingly to the link/containment popularity

14 / 32

## Dewey Code

Nodes in database have Dewey codes  $n_1.n_2.\dots.n_h$

For example, Dewey code **7.2.12** denotes the 12th left son of the 2nd left son of the root of the 7th document in our collection.

For every keyword **Dewey inverted index** store a list of Dewey codes of nodes (DIL) that directly contain this keyword

15 / 32

## Illustration from XRANK paper

16 / 32

## Minimal Answers Problem

Given Dewey inverted lists for all query terms to return a list of Dewey codes of all minimal answers

17 / 32

## Algorithm for Minimal Answers (1/2)

**Single pass:** every time read a next code in union of DILs

Keep an auxiliary data structure **Dewey stack** for the last scanned read node  $v$ :

for every predecessor of  $v$   
keep a set of keywords  
that are contained\* prior-or-equal to  $v$   
ignoring complete nodes

18 / 32

## Algorithm for Minimal Answers (2/2)

Update for Dewey stack from  $v$  to  $u$ :

- 1 find a lowest common predecessor  $w$  for  $v$  and  $u$
- 2 Sequentially consider ancestors of  $u$  from bottom to top, add keywords of  $u$  to their set in Dewey stack
- 3 Stop at root, or with identical set update or on the first complete node
- 4 In latter case output this node to the list of minimal answers

19 / 32

## Conceptual Graph Matching

**Query** is a tree with labelled edges and nodes

**Database** is a family of trees

**Domain information:** similarity between edge/node labels

**Task:** to find a tree in DB with maximal similarity to query tree

20 / 32

## Illustration from Conceptual Matching Paper

21 / 32

## Similarity Formula

$$TreeSim(Q, R) = NodeSim(q_0, r_0) + \max_{\text{children matching } \pi} \left( \sum_i EdgeSim(q_0 q_i, r_0 r_{\pi_i}) \cdot TreeSim(Q|_{q_i}, R|_{r_{\pi_i}}) \right)$$

22 / 32

## Recursive Algorithm for Graph Matching

Compare query tree with every tree in DB separately:

- 1 Compute *TreeSim* for every pair of *Q* and *R* roots' children
- 2 Find the best matching by applying Bellman-Ford algorithm

Complexity for *l*-branch trees of depth *d*:

$$C(d+1) = l^2 C(d) + l^4 + const$$

$$C(d) = \mathcal{O}(l^{2d+2}) = \mathcal{O}(n^2 l^2)$$

In general, time complexity is  $\mathcal{O}(n^4)$

23 / 32

## XSEarch Model

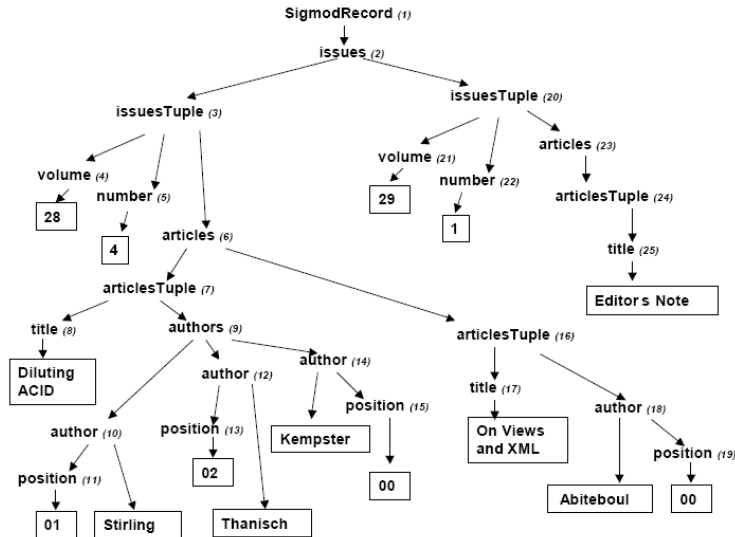

**Database:** huge XML tree with labels on internal nodes and keywords on leafs

**Query terms:** "label:keyword", "label:", ":keyword"

**Answer:** a set of **interconnected** nodes that together satisfy all query terms

24 / 32

## Illustration from XSEarch Paper

25 / 32

## Interconnection

Nodes  $u$  and  $v$  are **interconnected** iff on the shortest path between them only labels of  $u$  and  $v$  can coincide

26 / 32

## Properties of Interconnection

For  $u$  being ancestor of  $v$ :

$$InCon[u, v] = InCon[u, parent(v)] \& (label(u) \neq label(parent(v))) \& InCon[son_v(u), v] \& (label(son_v(u)) \neq label(v))$$

Otherwise:

$$InCon[u, v] = InCon[u, parent(v)] \& (label(u) \neq label(parent(v))) \& InCon[parent(u), v] \& (label(parent(u)) \neq label(v))$$

Using these formulas we can compute  $InCon$  for all pairs in  $\mathcal{O}(|\mathcal{T}|)$  for all pairs by dynamic programming

27 / 32

## Directions for Further Research

- Algorithms for **online** conceptual graph matching
- Queries using arithmetic: "what is the most popular movie (according to IMDB) I have not seen yet?"
- Automated inference for RDF statements? Semantic search for the case when the answer is not in the DB, but can be derived from it.

28 / 32

## Call for participation

Know a relevant reference?  
Have an idea?  
Find a mistake?  
Solved one of these problems?

- Knock to my office 1.156
- Write to me [yura@logic.pdmi.ras.ru](mailto:yura@logic.pdmi.ras.ru)
- Join our informal discussions
- Participate in writing a follow-up paper

29 / 32
